Instructions

The following tables provide a list of animals that will normally be encountered in a particular location. The tables are separated into two sections, Terrestrial and Aquatic. Terrestrial locations are all those locations that are primarily land. Aquatic locations are those locations that are either completely covered in water or at least partially covered. Lakes & Rivers, and Wetlands are included in the Aquatic section.

A separate table is provided for each of the 5 climate types, Tropical, Subtropical, Temperate, Subpolar, and Polar. In each table there is a separate column for each of the habitats that occurs in that climate type, which lists all of the animals that may be encountered in that climate and habitat.

To use this table, follow these steps:

- 1) Determine the climate type. Refer to section [8.1a] of the Bestiary for details of the 5 climate categories. A map of Earth's climate zones is provided at <http://www.betabunny.com/predators/images/world-temperature.gif>. For Fantasy world settings, you will have to make a determination on where the climate zones are located.
- 2) Determine the predominant habitat. Refer to section [2.1], Table: Climates and Habitats, and Section [8.1b] for details, of each habitat's characteristics, and of which habitats occur in a which climate zone.
- 3) Determine any secondary habitat types. Certain areas may have characteristics of several habitat types. For instance, farmland, which is on the edge of a forest, will see both animals that inhabit farmland habitats and Forest habitats. Additionally, certain habitat types occur within another habitat and will see animals from more than one habitat category. For instance, at a river running across grassland, you will encounter both animals from the Rivers & Lakes habitat and the Grassland habitat. Indeed, many of the animals from the Grassland habitat will come to drink at the river or lake, or to hunt other animals doing so. Likewise, villages and towns will see animals both from Urban
- 4) Select an animal from the list for the encounter. Each animal in the Bestiary is given a Frequency rating which indicates how often an animal of that type is likely to be encountered in the wild. You can use this a guideline in choosing which animals the party may encounter. Details are also provided in the animal's description of how many of that species will typically be encountered (see the Organization entry and Behavior entry).

Notes

Ruins, Crypts, and Caverns are not included in these encounter tables. For these habitats, use the encounter table for the particular climate and habitat in which the Ruin, Crypt, or Cavern occurs. No animal in *Bestiary: Predators* will typically venture deep into a Crypt or cavern, except rats. Many species will, however, be found sheltering in Caverns, or will have their lair in a Crypt or Cavern, provided the entrance is large enough to admit them. It should also be noted that Hyenas have a reputation as grave robbers, and may frequently be encountered in association with Crypts and burial sites. Also, many species will be attracted by corpses if they are not properly buried. It should also be noted that of all species, tigers appear to have a particular liking for ruins, and are frequently encountered near ruins.
